

Fall Fertilization

Fall is a great time to feed your lawn with fertilizer; it will strengthen your lawns roots and help it thrive through the winter months. When you fall fertilize you will have better fall and winter color, earlier spring green-up, increased shoot density, improved growth, and cold hardiness. Fertilizer contains three essential nutrients; nitrogen for color and growth, phosphorus for healthy roots, and potassium for overall health of your grass and helps with disease resistance, drought protection and cold tolerance.

Winterize Your Irrigation System

To winterize your sprinkler system water needs to be removed from the mainline. Leaving water in your irrigation system in freezing conditions can cause damaged pipes. The basic winterization clears most of the water in your mainline, for extra insurance we recommend our pressurized service. With pressurized winterization we include the basic shutoff and then use compressed air to push water through the main, lateral lines, and sprinklers to clear out as much water as possible. Call our office to get on the schedule!

Fall Cleanup

Please be sure and get your fall clean up scheduled early! Many of our customers utilize this service and we want to assure your lawn and landscape needs are met!
